

THE MOST WIDELY USED SOFTWARE IN 2015

We expect a software invention we are now developing to become the most widely used software product within three to five years. That invention is *interactive movable type*. As movable metal type brought about a revolution in print-on-paper publishing and led to extensive increases in literacy and to the operation of public schools in many nations – interactive movable type will bring about a revolution in electronic publishing and will lead to universal literacy and to a manyfold increase in the consumption of text in every nation.

Interactive movable type (which, for short, is sometimes called “muvable type”) is the centerpiece of a new information technology, *the mudoc technology*. Interactive movable type and the other tools of the mudoc technology are described in considerable detail at The Mudoc Corporation’s website, www.mudoc.com. In addition, *MuvieTime*, an 18-minute video presentation on DVD describes and simulates interactive movable type and is available at no charge. To request a copy send the address to which you would like it mailed to: DVdrequest@mudoc.com. (A poorly reproduced copy of *MuvieTime* is now available on YouTube.com, but the DVD provides better-defined text images and sounds.)

If, after taking a look at the tools of the mudoc technology, you think you might be interested in participating in their development, implementation, and/or utilization, take a look at our Web page “Call for Collaborators, Contributors, and Co-conspirators” at <http://mudoc.com/collab.htm> and let us know what you might like to do with us.

Wayne R. Porter, CEO

The Mudoc Corporation

Developers of interactive movable type

and the tools of the mudoc technology

(mudoc is a contraction of "meaning unit document"

and is pronounced with a long u as in "music")
